BACKGROUND

Evolution of requirements for building construction during the past two decades led to significant changes in materials, construction solutions and technologies. Crucial aspects include major effort to decrease energy consumption of buildings and eliminating environmental impacts related to CO2 emissions.

Reducing the amount of non-recyclable waste and, at the same time, increasing the quality of buildings' internal and external environment. It is the application of intelligent systems in buildings that presents itself as one of the most perspective ways of achieving sustainable construction of buildings
